

Ruby Method Exercises

1. Simple Greeting

Create a method which greets you when given a name. The method should return a string.

It should function as follows:

```
name = "Bob"  
greet name # => "Hello Bob!"
```

2. Many Greetings

Repeat exercise 1, but instead of return a string use the 'puts' command to output the greeting 5 times.

3. Multiply

Create a 'multiply' method to multiply any two given numbers.

For example:

```
multiply(2, 10) # => 20
```

4. Default Values

Repeat exercise 1, but this time specify a default value for the name.
